60kW Energy Storage Container Transaction in Southern Europe

Overview

What is the European energy storage inventory?

A new interactive platform—the European Energy Storage Inventory —has been launched to provide near real-time insights into energy storage deployment across the EU, marking a major step toward a smarter and more sustainable energy system.

How much energy storage will Europe have in 2024?

Many European energy storage markets are growing strongly, with 4.9 GW (12.1 GWh) of utility-scale (front-of-the-meter) energy storage deployed in 2024, giving an estimated total of more than 13 GW. Different studies have analysed the likely future paths for the deployment of energy storage in Europe.

How much energy storage will Europe have by 2030?

They point to more than 200 GW and 600 GW of energy storage capacity by 2030 and 2050 respectively (from roughly 89 GW in 2024, mainly in the form of pumped hydro storage). Compared to 2024, an additional 128GW/300GWh of electrochemical storage is expected to be added to European grids by 2030.

How does energy storage work in the EU?

The main energy storage method in the EU is by far 'pumped storage hydropower', which works by pumping water into reservoirs when there is an electricity surplus in the grid - for example on a sunny or windy day - and releasing it when more energy is needed.
