**A battery pack consists of 32 in parallel and 96 in series**

## Overview

What is a battery pack configuration?

Battery pack configurations determine how much power a battery can provide and for how long. Whether you're choosing a battery pack for an electric vehicle, a robotics project, or an energy storage system, understanding the difference between series and parallel connections can help you make the best decision.

What is the difference between a series and parallel battery?

**Series Connection:** In a battery in series, cells are connected end-to-end, increasing the total voltage. **Parallel Connection:** In parallel batteries, all positive terminals are connected together, and all negative terminals are connected together, keeping the voltage the same but increasing the total current.

How many cells in a battery pack?

Step 3: Calculate the total number of cells:  $\text{Total Cells} = \text{Number of Series Cells} * \text{Number of Parallel Cells}$   
 $\text{Total Cells} = 7 * 6 = 42$  cells So, you would need 42 cells in total to create a battery pack with 24V and 20Ah using cells with 3.7V and 3.5Ah.

How does a battery pack work?

When designing a battery pack, cells can be connected in two ways: in series to increase voltage, or in parallel to increase capacity. Series connections add the voltages of individual cells, while the parallel connections increase the total capacity (ampere-hours, Ah) of the battery pack.

A battery is defined as an electrical element where chemical reactions produce electrical potential. Each electrochemical reaction has a limit to the electric potential difference it can generate between two electrodes. Battery cells are where electrochemical reactions occur to produce a limited electric potential
