## Overview

---

What is a battery backup unit (BBU)?

In data centers, they serve as bridge power sources until primary power sources recover and are considered essential infrastructure for enhancing overall system reliability. Battery Backup Units (BBUs) are specifically designed to provide short-term backup power for several seconds to minutes during momentary power fluctuations or outages.

How does a BBU work?

The BBU uses a built-in battery (e.g., a lithium-ion battery) to quickly switch power during a main power failure, sustaining device operation for a few seconds to several minutes. This ensures data is saved or the system shuts down safely, preventing data loss or hardware damage. BBUs are usually used in conjunction with PSUs (Power Supply Units).

What is a baseband unit (BBU)?

The baseband unit (BBU) is a crucial component in mobile base stations, handling tasks like signal processing, resource allocation, and protocol management to ensure efficient communication between mobile devices and networks. It also ensures security through encryption and manages interference and network operations.

Are BBU batteries safe?

The proliferation of BBUs has brought safety challenges to the forefront. The integration of multiple lithium-ion battery cells within BBU systems increases the risk of serious incidents—including swelling, rupture, and fire—especially as batteries deteriorate due to overcurrent, overcharging, or repeated charge-discharge cycles.
