# Battery reverse charges the inverter

## Overview

---

What is the difference between solar power and inverter charging?

The only difference is the setting on your charging controller, which we will start to review now. Solar power is the most common way to charge your battery while connected to an inverter. It acts as a battery charger that provides constant voltage to keep your battery charging.

How do you charge a battery with a solar inverter?

To address this, solar power is the most preferred method for charging the battery while using the inverter, especially in off-grid situations or during power outages. Setting up a solar charging system involves using a solar panel, a solar charge controller, and proper battery connections.

Can a power inverter charge a battery?

A power inverter is great for energy needs. It can easily take battery DC power and convert it to AC power. However, as you use that AC electricity, your battery life starts to go down, and you need a charge. Eventually, a power inverter will leave you with a dead battery unless you can charge your battery while connected to an inverter.

How does a battery inverter work?

Inverter uses the battery to generate AC power. As the inverter works and provides AC electricity to things such as lights and appliances, it can easily drain the battery's DC power. This means you must find a way to charge the battery continually so your inverter can keep giving the AC power as needed.
