# **Does energy storage require a water cooling system**

## Overview

---

Is a water cooling system necessary?

A water cooling system is necessary for cooling down machines like computers and gaming devices that tend to overheat during operation. Every computer, from the smallest home theatre PC to the mightiest gaming platform, generates heat that can damage the interior if ignored.

Why do you need a storage water cooler?

The consumption of chilled water in places like schools, colleges, offices and other commercial buildings is always high and frequent. Hence a robust water cooler, which cools water super fast is needed. The range of storage water coolers has rugged and powerful compressor and an all stainless steel body for more durability.

How do thermal energy storage systems work?

Fig. 1 Central Energy Plant at Texas Medical Center Thermal energy storage systems utilize chilled water produced during off-peak times - typically by making ice at night when energy costs are significantly lower which is then stored in tanks (Fig. 2 below).

Where can thermal energy storage be found?

Thermal Energy Storage (TES) for chilled water systems can be found in commercial buildings, industrial facilities and in central energy plants that typically serve multiple buildings such as college campuses or medical centers (Fig 1 below).
