## Overview

Can a gel battery be used on a solar system?

Gel batteries, like AGM batteries, can be particularly useful for small, off-grid solar systems. For example, a remote cabin with low energy demand and a small system on the roof may be the perfect candidate for a gel or AGM battery bank.

What is a gel battery?

Gel batteries are a type of rechargeable battery that uses an electrolyte in gel form instead of liquid. This gel is composed of sulfuric acid, water and silica, and is thicker than the liquid electrolyte used in conventional lead-acid batteries. The gel acts as a medium to transport electrical charges between the battery's electrodes.

Why should you choose a gel battery?

Gel batteries are sealed and airtight, significantly reducing the risk of corrosive acid leaks. This makes them safer and easier to handle, without the need for regular maintenance, such as adding distilled water, which is common with conventional lead-acid batteries. No maintenance reduces costs over the life of the battery. 3. Vibration resistant.

Can a gel battery be mounted horizontally or vertically?

A gel battery can be mounted horizontally as well as vertically and doesn't release hydrogen gas during normal operation. Gel batteries are costlier and have better deep-cycling capability as compared to flooded lead-acid batteries. Gel batteries can be shipped by air, as they are sealed and are leak- and spillproof.
