How many watts of emergency solar panels should I buy

Overview

How many watts do you need to power up a solar panel?

Suppose we want to power up four lights each of 15 watts and a fan of 60 watts and we need to use these 4 lights and 1 fan for 4 hours every day. So first, we will calculate total watts usage. Required Load in Watts $P_{Total} = (4 \times 15W) + 60W = 120 \text{ Watts}$. This is our daily load per hour in watts we need to power up by solar panels.

How much power do solar panels get?

Try to orient your panels so that they directly face the sun, in order to get the most power, and you may get between 50% and 80% of their rated power. In shade, expect maybe 25%, in overcast and rain, maybe 5-10%. I do recommend these panels.

How do I set up solar panels?

Select the nominal voltage of your battery bank. Select the lowest temperature that you expect your solar panels to be exposed to in daylight. Enter the number of solar panels wired in series. If you have multiple strings in parallel, enter the number of series-wired solar panels in each string.

How do I use the energy consumption calculator?

Select an appliance from the list or enter one manually. If you select an appliance from the list, the calculator will estimate the power usage of the chosen appliance, and if the appliance operates on a duty cycle, the calculator will take that into consideration when calculating its energy consumption.
