How much electricity can a 12v battery store

Overview

How much energy does a battery hold?

To calculate how much energy a battery holds in watt-hours, use: If your battery capacity is in mAh (milliamps), convert it to Ah first: You have a 12V battery rated at 100Ah. So it stores 1200 watt-hours of energy. If you're powering a 100-watt device:

How much energy can a battery store?

This does not directly tell you how much energy the battery can store, but can be a more useful value in deciding how long a circuit will run from a battery. For example, a car battery might be rated for 50 Ah. That means in theory it could source 50 A continuously for 1 hour and then go dead.

What is battery capacity?

Battery capacity tells you how much energy a battery can store and deliver over time. It's usually expressed in: To calculate how much energy a battery holds in watt-hours, use: If your battery capacity is in mAh (milliamps), convert it to Ah first: You have a 12V battery rated at 100Ah. So it stores 1200 watt-hours of energy.

How many watts can a 12V battery run?

It can output a total of 130A at around 15.6V maximum, or about 1600W in total - only half the total possible power draw. This is what runs the 12V systems while the car is turned on, provided that the total power draw is not more than 1600W. If it is, the battery will serve to fill in the excess temporarily.
