Huawei tool battery parameters are generally

Overview

What parameters are displayed when a battery model is set?

These parameters are displayed when Battery Model is set to a lead-acid battery model. The float charge voltage should be lower than the equalized charge voltage. The equalized charge voltage should be greater than the float charge voltage. Set this parameter based on the actual condition.

How to remove waterproof gland from Huawei power module?

Use a wrench to remove the waterproof gland from the power module. the battery module and power module. Take the disassembly wrench out of the decorative cover. In capacity expansion scenarios, you need to separately purchase bottom cascading cables from Huawei Digital Power.

How to set battery cable length based on site requirements?

Set this parameter based on the site requirements. When each battery string is connected to the RTN+ busbar using one cable, set Battery Cable Length to half of the total length of cables between both ends of a battery string and the positive and negative busbars, and set BatCableCrss-SecArea to the cross-sectional area of the cable.

What happens if multiple battery modules are used in a parallel system?

In a parallel system, if the number of battery modules on the master and slave products are different (not recommended), the products with larger capacity may fail to fully discharge in heavy load scenarios. In a system with one power module and one battery module, when the ESS supplies power independently, the load power cannot exceed 2.5 kW.
