

Installation of solar panels on the sloped roof of the villa

Overview

Where should photovoltaic panels be installed?

The choice of location is a critical factor during the installation of photovoltaic panels. Roofs—flat or sloped—are the most common installation sites, offering excellent sun exposure and energy production optimization. However, in some cases, such as when the roof is unsuitable, ground installation may be a better option.

Can a wall install a photovoltaic system?

Although less efficient, wall installations can supplement a photovoltaic system effectively. Balcony-mounted panels are primarily used in residential buildings. Typically, 1-2 panels are installed on the balcony railing. This setup can help reduce energy costs for apartments where roof installation is not feasible.

Should you install photovoltaic panels on your property?

Year by year, more people choose to install photovoltaic systems on their property. When opting for this form of energy generation, it is crucial to select appropriate panels and consider the right location for the installation.

Which direction should solar panels be installed?

An interesting alternative is splitting the panels between east and west directions. This arrangement better matches energy production to daily demand, which often peaks in the morning and afternoon/evening. Installing panels facing north, however, is not recommended, as it significantly reduces energy output, making the system inefficient.
