# Inverter adjusts charging power

## Overview

How does an inverter charge a battery?

As the battery's SOC increases, the charging current gradually decreases. Once the battery reaches a specific voltage threshold, the inverter charger switches to absorption charging mode. In this phase, the charger maintains a constant voltage while gradually reducing the charging current. The battery continues to charge, albeit at a slower pace.

How long does it take an inverter to charge a battery?

Typically, an inverter may take anywhere from 6 to 12 hours to full charge a standard tubular battery. The key influencer here is the charger's output capacity—higher capacities result in faster charging times. Conversely, UPS systems tend to charge more quickly due to their smaller battery sizes and efficient charging mechanisms.

What are the features of a modern inverter charger?

Modern inverter chargers incorporate advanced monitoring and protection features to ensure the safety and longevity of the battery system. These features include: - Battery temperature compensation: Adjusts the charging voltage based on the battery's temperature to prevent overcharging or undercharging.

Why is my inverter not charging?

An inverter failing to charge the battery can be frustrating. Common reasons include incorrect settings, battery faults, or wiring issues. Firstly, verify the inverter settings to ensure they match your battery specifications. Battery issues can also hinder charging. Check for any visible signs of damage, such as swelling or leakage.
