What is a permanent magnet generator (PMG)?

A permanent magnet generator (PMG) is a type of electrical generator that converts mechanical energy into electrical energy using the magnetic field generated by permanent magnets.

What are permanent magnet generators used for?

Permanent magnet generators are commonly used in: Small wind turbines, where their efficiency and simplicity make them suitable for variable wind conditions. Portable and small-scale power generation units, where space, weight, and reliability are crucial factors. Electric vehicles (EVs), where compact and efficient power generation is essential.

What are the different types of magnet generators?

These can broadly be categorized into two major groups: permanent magnet generators and electromagnet (or field coil) generators. As the name suggests, permanent magnet generators (PMGs) use permanent magnets to create the magnetic field.

How do permanent magnets work in a generator?

As the rotor spins, the permanent magnets move relative to the stator, the stationary part of the generator where the electric coils are located. The magnetic field from the permanent magnets interacts with the windings of the stator, inducing an electrical current.
