# Not communicating via a base station

**LFP 12V 100Ah**

## Overview

---

What is a communication base station?

Communication base station setups will usually include a wide array of different technologies, including power supplies, data servers, head end, radio repeaters, and communication systems that allow for high-speed continuous information flow. It can also be used as part of a leaky feeder system in the communication network.

Why is my base station not connecting?

If the above solutions don't resolve your base station connectivity issues, the problem can be due to a poor/ slow Wi-Fi connection. You should check your Wi-Fi network speed to ensure whether it isn't the reason. You can connect your phone or laptop to the Wi-Fi router. And then, open a Wi-Fi speed tester software on the web browser.

How does a mobile station communicate with a base station?

The communications between mobile station and base station occur concurrently via two air interface channels from each base station separately. Both channels (signals) are received at the mobile station by maximal combining Rake processing (see Figure 11.20 ). Soft handoff occurs in about 20–40% of calls. Figure 11.20. Soft handoff in CDMA.

Do I need a local base station?

So if the reference station is located too far or simply is absent in the area you will need a local base station. Other advantages of your own base are independence from the Internet connection and lack of NTRIP subscription fees.
