Offshore wind turbine substation

Overview

What are offshore substations?

Offshore substations (OSS) are hubs for the collection, transformation and transmission of electricity produced by offshore wind turbines. These structures convert electricity to higher voltages suitable for long-distance transmission to onshore substations, minimising power loss along the way.

How many substations does an offshore wind energy project need?

An offshore wind energy project will usually require between one and three offshore substations. The number of substations used is influenced by several factors, including the size and layout of the project, distance of the wind turbines from shore, and existing electrical grid infrastructure.

What is a wind turbine substation?

It acts as the central hub where the electrical output from the wind turbines is processed and conditioned for efficient long-distance transmission. These substations are designed to withstand the harsh conditions of the open sea while performing their critical function.

Who owns the offshore substation?

In the UK, the offshore substation is ultimately owned and operated by a transmission operator (OFTO), although the wind farm owner has access and responsibility for the array cable entry and wind farm switchgear. What's in it
