## Overview

---

Under the background of carbon neutrality, it is necessary to build a new power system with renewable energy as the main body. Power-side energy techniques receive attention because they are important means of remitting large-scale renewable energy grid-connected pressure. They could smooth generation output of intermittent renewable energy and improve frequency modulation and peak regulation capacity of thermal power generation units. In order to develop power-side energy storage techniques better, development status quo and typical application of existing energy storage techniques are discussed and sorted. The development trend of American and Chinese power-side energy storage techniques is analyzed. The development status quo, typical pilot applications, and performance comparison of major power-side energy storage techniques are introduced. The further prospects of power-side energy storage techniques in China are made. What is a shared energy storage-assisted power generation system?

3. Combined operational and cost allocation models for shared energy storage-assisted power generation systems Here, the power generation system comprises a collection of renewable energy power stations ( $n = 1, 2, \dots, n, N$ ), specifically wind power plants and photovoltaic power plants, which are connected to a shared energy storage power station.

Can shared energy storage be implemented in power generation side?

The proposed operation and cost-sharing model is anticipated to serve as a useful reference for the widespread implementation of shared energy storage in power generation side. 1. Introduction.

Can a centralized shared energy storage mechanism be implemented in power generation side?

5. Conclusions and future research directions This paper proposed the implementation of a centralized shared energy storage mechanism in power generation side, which enables multiple renewable energy power stations to collaborate and invest in a shared energy storage system.

## What is shared energy storage?

The role of shared energy storage on the power generation side of the power system differs from the previous two applications. It serves to support the operation of thermal power units, enhance the reliability of renewable energy generation connected to the grid, and potentially remove the need for constructing alternative units.
