**Ps The distance between the conductor and the battery cabinet**

## Overview

---

How far should a charge controller be from a battery bank?

It is highly recommended that the charge controller be within one meter (approximately 3.25ft) of the battery bank and in the same room or enclosure. Be sure all rooms and enclosures are well ventilated. Lead acid batteries produce flammable hydrogen gas. Significant voltage drops occur not only with excessive distance but with improper wire size.

Why should we consider conductive parts in the design & use of electrical devices?

In the design and use of electrical devices we must manage conductive parts with different electrical potential, with even very high voltage differences. The risk of formation of electric arcs in the air and creeping currents on the surface of the insulation material must be considered.

Why are exposed conductive parts difficult to find?

In daily experience it is difficult to come across exposed conductive parts as, for electrical safety reasons, they are separated from the user and electrically isolated in protective cases.

How do I size a phocos controller wire?

Check the back page of the Phocos catalog to view a quick guide for wire sizing. Measure the voltage at the controller, and measure the voltage at the battery terminals. If there is a 0.5V difference or more, reduce the wiring distance or decrease the wire gauge.
