Sierra Leone UPS Uninterruptible Power Supply Service Introduction

Overview

What is an uninterruptible power supply (UPS) system?

Abstract. In the modern world, when there is a power outage or a power failure, telecommunication systems, computer systems, and many other critical equipment, such as medical equipment, require uninterrupted power to support their operation. Uninterruptible power supply (UPS) systems are used for this purpose.

What is an uninterruptible power supply system?

Uninterruptible Power Supply System When utility mains are not available, electricity can be supplied from a source such as a standard connected equipment UPS, which provides power supply. UPS is mostly used for critical loads and is kept between commercial utility mains.

How do UPS systems work?

Such UPS systems use energy storage technologies such as batteries or flywheels to provide power to loads in the absence of applied power. Typically, static power electronics such as fast-switching high-current insulated gate bipolar transistors (IGBTs) are used to convert power.

What are the components of a UPS system?

Components: Parts of a typical UPS system are an inverter, which transforms stored DC power back into AC power after a power loss, a battery, which stores electrical energy, and a rectifier, which converts incoming AC power to DC power for charging the internal battery.

Single- or three-phase power is obtained from the power system and is rectified to DC. Floating on the DC bus is a battery bank that provides energy storage to keep the system operating during an interruption. Clearly, the larger the battery bank, the longer the system can operate.
