## Overview

Can graphite be used as a top electrode for perovskite solar cells?

During the solid-to-solid electrode transferring process, it is essential to achieve effective contact and to avoid damage of bottom functional layers for an improved device performance. In this work, a sprayed graphite layer on conductive substrate is employed as transferred top electrode for perovskite solar cells.

Why is graphite important for the production of solar cells?

For the production of multicrystalline and monocrystalline silicon, the most important raw material in the production of solar cells in the photovoltaic industry, we are developing essential components based on specialty graphite for the highly sensitive process of crystal growth.

Can graphite micron sheets be sprayed on conductive cloth for perovskite solar cells?

4. Conclusion In conclusion, graphite micron sheets were sprayed on conductive cloth as a transferred top electrode for perovskite solar cells. Further mechanical polishing treatment can reduce the roughness of graphite layer and even optimize the orientation of the graphite sheets.

Which solar cell is more efficient TiO<sub>2</sub> or graphite?

We observed the solar cell made of graphite powder only shows higher efficiency than the solar cell made of TiO<sub>2</sub> powder only. The efficiency of the graphite-only solar cell was 0.76% while the efficiency of TiO<sub>2</sub>-only solar cell was 0.03%.
