Solar panels on-site energy network cable

Overview

What solar cables do you supply?

We supply solar aluminium cables and low voltage DC combiner cables to run from the panels to the inverter / transformer, as well as the cables for the wider grid integration and connection, both on private networks contestable connections. EN 50618 superseded the previous solar cable approvals of PV1-F cable from TÜV Rheinland Group.

How to connect a solar panel in series?

With the provided cables, connect the positive terminal of panel one with the negative terminal of panel two. This should be done sequentially for all other panels. This circuits the panels in series which steps up the voltage but maintains the same amount of current.

What is a series connection on a solar panel?

In contrast, a series connection refers to linking the positive terminal of one solar panel to the negative terminal of the next panel. Connect the positive and negative cables of the charge controller to the corresponding terminals of the solar panel array. To ensure a safe connection, you can get assistance from the manufacturer's instructions.

What is a photovoltaic cable?

These photovoltaic cables cover the full range of cable interconnections between the solar panels and the wider components of the photovoltaic system including converter boxes, inverters, transformers, and local grid substations.
