Special fan for energy storage container

Overview

Can a battery container fan improve air ventilation?

The existing thermal runaway and barrel effect of energy storage container with multiple battery packs have become a hot topic of research. This paper innovatively proposes an optimized system for the development of a healthy air ventilation by changing the working direction of the battery container fan to solve the above problems.

How to improve airflow in energy storage system?

The aim of this strategy is to improve the fan state at the top so that the entire internal airflow of the energy storage system is in a circular state with the central suction and the two blowing ends. Optimized solution 4: fans 3 and 9 are set to suction state and the rest of the fans are set to blow state.

Does airflow organization affect heat dissipation behavior of container energy storage system?

In this paper, the heat dissipation behavior of the thermal management system of the container energy storage system is investigated based on the fluid dynamics simulation method. The results of the effort show that poor airflow organization of the cooling air is a significant influencing factor leading to uneven internal cell temperatures.

What is energy storage system (ESS)?

The energy storage system (ESS) studied in this paper is a 1200 mm × 1780 mm × 950 mm container, which consists of 14 battery packs connected in series and arranged in two columns in the inner part of the battery container, as shown in Fig. 1. Fig. 1. Energy storage system layout.
