Substations must be equipped with energy storage

Overview

Should substations include battery storage?

By incorporating battery storage, substations can ensure a continuous and reliable power supply, even during emergencies. Maintenance programs must be expanded to include electrical substation maintenance routines specific to energy storage interfaces. Visit our Substation Maintenance training course.

How many DC supply systems are required for a substation?

There must be either one or two 110V DC supply systems to supply the control and protection circuits for the major plant and ancillary systems within the substation, plus one or two 48V DC supply systems if required, to supply communications and SCADA control equipment.

What are the building requirements for a substation?

Currently there is no specific ASA standard with building requirements for a substation Site location considerations Design life Spatial requirements Building fabric and architectural features Section 20 - Equipment installation requirements including references to "General" and "ASA Standard" drawings where applicable.

How much power does a substation use?

The lines initially provide power to the 132KV bus A of the substation. Given that the distance between the substation and the generating station is merely 50 km, the SIL may augment to 1.2 times the theoretical value. Consequently, the substation's intake may reach up to (108×1.2) MW, around 130 MW.
