# **The difference between three-phase inverter and string**

## Overview

---

What is a three-phase string inverter system?

Three-phase string inverter systems convert the DC power generated by the photovoltaic (PV) panel arrays into the AC power fed into a 380 V or higher three-phase grid connection.

What is the difference between a single phase and a three phase inverter?

Single-phase inverters convert DC input into single-phase output. The output consists of one phase (A- N, B- N, or C- N), formed by one live and one neutral conductor, with a standard voltage of 220 V — mainly for residential use. Three-phase inverters convert DC power into three-phase supply, generating three equally spaced AC phases.

Do you need a 3 phase inverter?

If your home is equipped with a three-phase power supply, you have more options. You can either opt for a single phase inverter or a three-phase inverter. The advantage of using a three-phase inverter is that it can distribute the generated solar power evenly across the three phases.

Are three-phase inverters better than single-phase systems?

Compared with single-phase systems, three-phase inverters deliver more stable and efficient power and are preferred for commercial projects and high-energy residential buildings. Single-phase inverters convert DC input into single-phase output.
