What is a Li-ion battery energy storage system?

2. Executive summary Li-ion battery Energy Storage Systems (ESS) are quickly becoming the most common type of electrochemical energy store for land and marine applications, and the use of the technology is continuously expanding.

What is the state of charge of a lithium ion battery?

During discharge Li-ions travel back from the anode to the cathode. The term State of Charge (SOC) describes the energy (typically referred to as capacity) available for use in the battery. A fully charged battery has an SOC of 100%, while a fully discharged battery has an SOC of 0%. Figure 1. Basic principles and components of a Li-ion battery.

How do li-ion batteries behave in fire conditions?

From a fire protection point of view, these two properties combined have created a whole new challenge: in fire conditions, Li-ion batteries behave in a fundamentally different way than batteries with water-based electrolyte. (cathode) and a negative electrode (anode).

Do I need a full battery Space Review?

Of-gas detection is specifically required in most rules. In general, a comprehensive, project-specific review is required for the full battery space, including issues such as battery arrangement in the space, ventilation, explosion control, and run-of water management.
