**The largest metal in energy storage batteries**

## Overview

---

Lithium is currently the most sought-after metal in the energy storage sector, predominantly utilized in lithium-ion batteries. Which battery system is best for high-performance energy storage?

Beyond lithium, other emerging battery systems, such as aqueous zinc batteries (AZBs), sodium-ion batteries (NIBs), and potassium-ion batteries (PIBs) are promising candidates for high-performance energy storage [24 - 27].

Why is lithium a good battery material?

Lithium, the lightest metal and a three-atomic-number alkaline metal, has high heat conductivity. Due to its tremendous reactivity and great energy density, it is a fantastic material for batteries used in consumer devices, renewable energy storage systems, and electric car batteries.

How many batteries are in a battery energy storage system?

Battery energy storage systems (BESS) store energy from different sources in a rechargeable battery. The total number of batteries depends on several factors: the number of cells per module, the modules per rack, and the racks connected in series. For instance, a BESS can consist of 5,032 modules containing over 100,000 lithium-ion batteries.

Are liquid metal batteries a viable energy storage solution?

Liquid metal batteries are being explored as a potential large-scale energy storage solution due to their requirement for higher energy density. Antimony's relatively low melting point makes it an appealing choice for such batteries.
