# Uninterruptible power supply automatically shuts down

## Overview

---

What happens if a UPS system fails?

Uninterruptible power system (UPS) failures can spell disaster for businesses that rely on this form of backup power to prevent critical data loss. In fact, UPS system failure ranks as the No. 1 cause of unplanned data center outages, according to a report from the Ponemon Institute.

Why does my ups turn off if the battery is missing?

My first thought is if the battery is missing/loose/disconnected and effectively is removed from the equation, if there is a slight power flicker or event, the UPS would turn off. Though, the UPS is supposed to alarm when the battery is disconnected, or as you said, is present but requires replacement (after a failed self test).

Why is an ups device important?

A UPS device is essential to prevent the loss of crucial data since a sudden power outage can force systems and computers to shut down without saving open files. A UPS failure is when the system works incorrectly or the outage lasts longer than the UPS battery supply.

What is an ups & how does it work?

A UPS is a power solution that allows electrical devices such as computers to continue running during a power surge or outage. UPS devices maintain and replenish energy storage as long as utility power is available. The more energy your UPS is able to store, the longer you'll be able to maintain a power supply.
