Waste heat power generation is an energy storage power station

Overview

How does waste heat to power work?

Waste heat to power (WHP) technologies produce electricity by capturing waste heat—typically from exhaust gas or industrial processes—and converting this waste heat to electricity. WHP systems utilize otherwise wasted thermal energy to drive turbines or engines that can produce electricity for on-site consumption or grid export.

What is waste heat-to-power technology?

Waste heat-to-power technologies recover energy from waste heat and convert it into electricity. However, the temperatures of waste heat streams are generally too low to generate electricity using traditional steam turbine technology.

What is the recovery of waste heat for power?

The recovery of waste heat for power is a largely untapped type of combined heat and power (CHP), which is the use of a single fuel source to generate both thermal energy (i.e., heating or cooling) and electricity.

What is waste heat to Power (WHP)?

Waste heat to power (WHP) is the process of capturing heat discarded by an existing thermal process and using that heat to generate power (see Figure 1).
