Overview

What is the minimum string size of a PV inverter?

The minimum string size, then, is 15 modules. The maximum string size is the maximum number of PV modules that can be connected in series and maintain a voltage below the maximum allowed input voltage of the inverter. The Module Voc_max is calculated using the coldest temperature when the modules produce the highest expected voltage.

How does a string inverter work?

Most modern string inverters have a multiple power point tracking (MPPT) that operates within a specific voltage range. Checking the minimum voltage does two things: Checking the maximum voltage does two things: Checking the maximum Isc or maximum current does one thing: Checking the maximum connected power is below the inverter's max.

How many strings can be connected to a solar inverter?

Here are the results we calculated: This inverter has 2 MPPT trackers, so a total of 2 strings can be connected to the inverter. We know that there can only be 13 modules maximum installed. We can have one MPPT with 6 modules in a string and the other at 7 modules in a string. Check out UpTop Solar String Sizing Tool that does this for you!.

What is the maximum voltage a string inverter can run?

Maximum String Voltage: Ensure the total Voc does not exceed the inverter's maximum DC input voltage, typically 600V or 1000V for residential and commercial applications. **MPPT Voltage Range:** The inverter operates efficiently when the Vmp of the string falls within its MPPT range (e.g., 250-850V for utility-scale inverters).
